Approaches for Examining the Profession

National Standard of Competency for Architects 2021

1. Pathways to Registration (Diagram and 500 word text) Individual (20%)

2. Practice Manifesto - (10 point manifesto and 500 word text) Individual (30%)

PC1 Understand the regulatory requirements and obligations pertaining to practice as an architect, including professional codes of conduct and obligations for continuing professional development and professional indemnity insurance.

3. Portfolio of Practice File Notes-(CAA, Brief, SWC, EoT, Variation, Progress Certificate, PC Certificate, 1500 word text) Individual/Pairs (50%)

PC5 Understand the essential elements of a client architect agreement, across the range of procurement methods and the different scales and types of project.

PC6 Understand appropriate processes for reporting and varying the scope of services provided by an architect.

PC7 Understand appropriate processes for clear and consistent communication with clients and relevant stakeholders throughout a project, including obtaining approvals from clients and stakeholders.

PC15 Understand legal and ethical obligations relating to copyright, moral rights, authorship of cultural knowledge and intellectual property requirements across architectural services.

PC54 Understand the purpose of periodic site visits of construction works for quality assurance

PC56 Understand the purpose of identification of defects, rectifications and approval substitutions.

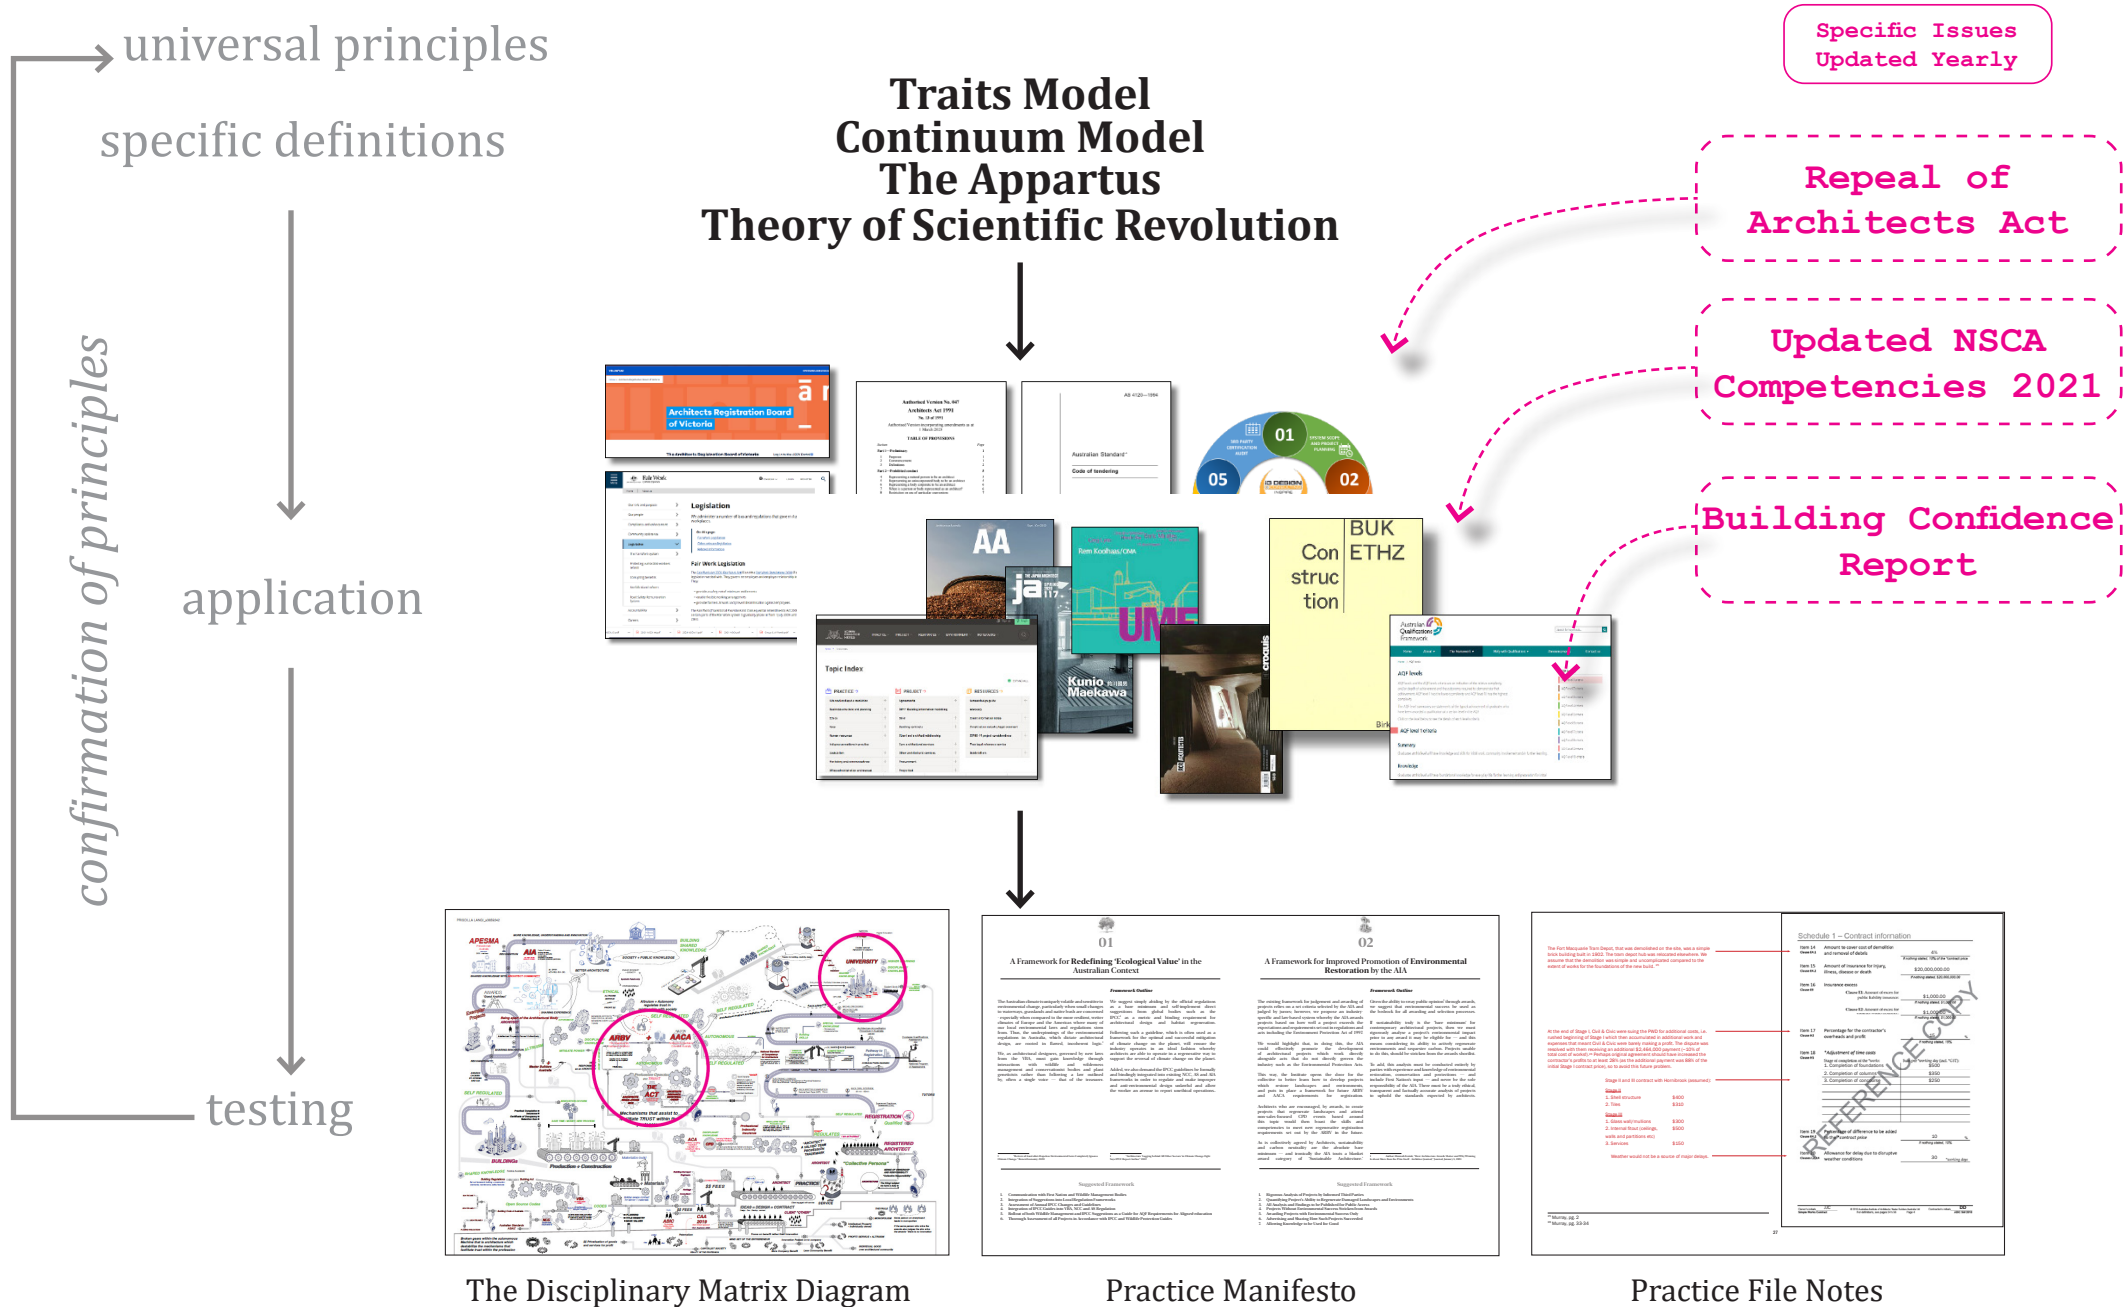

PC57 Understand the principles of contract administration, including certification, variations, instructions, requests for information and practical completion.

PC58 Understand the contract components – including all documents – and the process of executing a contract, as defined within the construction contract and in accordance with relevant building and planning codes.

A Framework for Redefining 'Ecological Value' in the Australian Context

Framework Outline

The Australian climate is uniquely volatile and sensitive to environmental change, particularly when small changes to waterways, grasslands and native bush are concerned - especially when compared to the more resilient, wetter climates of Europe and the Americas where many of our local environmental laws and regulations stem from. Thus, the underpinnings of the environmental regulations in Australia, which dictate architectural design, are rooted in flawed, incoherent logic.¹

We, as architectural designers, governed by new laws from the VBA, must gain knowledge through interactions with wildlife and wilderness management and conservationist bodies and plant geneticists rather than following a law outlined by, often a single voice — that of the treasurer.

We suggest simply abiding by the official regulations as a bare minimum and self-implement direct suggestions from global bodies such as the IPCC¹ as a metric and binding requirement for architectural design and habitat regeneration.

Following such a guideline, which is often used as a framework for the optimal and successful mitigation of climate change on the planet, will ensure the industry operates in an ideal fashion whereby architects are able to operate in a regenerative way to support the reversal of climate change on the planet.

Added, we also demand the IPCC guidelines be formally and bindingly integrated into existing NCC, AS and AIA frameworks in order to regulate and make improper and anti-environmental design unlawful and allow the worker an avenue to report unethical operations..

¹ "Review of Australia's Hopeless Environmental Laws Completely Ignores Climate Change," *RenewEconomy*, 2020

¹ "Architecture 'Lagging behind All Other Sectors' in Climate Change Fight Says IPCC Report Author" 2022

Suggested Framework

1. Communication with First Nation and Wildlife Management Bodies
2. Integration of Suggestions into Local Regulation Frameworks
3. Assessment of Annual IPCC Changes and Guidelines
4. Integration of IPCC Guides into VBA, NCC and AS Regulation
5. Rollout of both Wildlife Management and IPCC Suggestions as a Guide for AQF Requirements for Aligned-education
6. Thorough Assessment of all Projects in Accordance with IPCC and Wildlife Protection Guides

A Framework for Improved Promotion of Environmental Restoration by the AIA

Framework Outline

The existing framework for judgement and awarding of projects relies on a set criteria selected by the AIA and judged by jurors; however, we propose an industry-specific and law-based system whereby the AIA awards projects based on how well a project exceeds the expectations and requirements set out in regulations and acts including the Environment Protection Act of 1997.

We would highlight that, in doing this, the AIA could effectively promote the development of architectural projects which work directly alongside acts that do not directly govern the industry such as the Environmental Protection Acts.

This way, the Institute opens the door for the collective to better learn how to develop projects which restore landscapes and environments, and puts in place a framework for future ARBV and AACA requirements for registration.

Architects who are encouraged, by awards, to create projects that regenerate landscapes and attend non-sales-focused CPD events based around this topic would then boast the skills and competencies to meet new regenerative registration requirements set out by the ARBV in the future.

As is collectively agreed by Architects, sustainability and carbon neutrality are the absolute bare minimum — and ironically the AIA touts a blanket award category of 'Sustainable Architecture.'

Given the ability to sway public opinion¹ through awards, we suggest that environmental success be used as the bedrock for all awarding and selection processes.

If sustainability truly is the 'bare minimum' for contemporary architectural projects, then we must rigorously analyse a project's environmental impact prior to any award it may be eligible for — and this means considering its ability to actively regenerate environments and sequester carbon. Projects unable to do this, should be stricken from the awards shortlist.

To add, this analysis must be conducted entirely by parties with experience and knowledge of environmental restoration, conservation and protections — and include First Nation's input — and never be the sole responsibility of the AIA. There must be a truly ethical, transparent and factually accurate analysis of projects to uphold the standards expected by architects.

¹ Author: Hannah Feniak, "How Architecture Awards Matter and Why Winning Is about More than the Prize Itself - *Architizer Journal*," *Journal*, January 5, 2023

Suggested Framework

1. Rigorous Analysis of Projects by Informed Third Parties
2. Quantifying Project's Ability to Regenerate Damaged Landscapes and Environments
3. All Analysis and Findings to be Published for Public Access
4. Projects Without Environmental Success Stricken from Awards
5. Awarding Projects with Environmental Success Only
6. Advertising and Sharing How Such Projects Succeeded
7. Allowing Knowledge to be Used for Good

The Fort Macquarie Tram Depot, that was demolished on the site, was a simple brick building built in 1902. The tram depot hub was relocated elsewhere. We assume that the demolition was simple and uncomplicated compared to the extent of works for the foundations of the new build.²⁵

At the end of Stage I, Civil & Civic were using the PWD for additional costs, i.e. rushed beginning of Stage I which then accumulated in additional work and expenses that meant Civil & Civic were barely making a profit. The dispute was resolved with them receiving an additional \$2,464,000 payment (~10% of total cost of works).²⁶ Perhaps original agreement should have increased the contractor's profits to at least 28% (as the additional payment was 88% of the initial Stage I contract price), so to avoid the future problem.

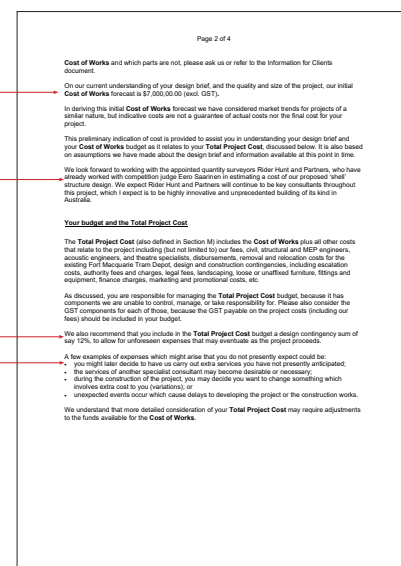

Stage II and III contract with Hornibrook (assumed):

Stage II	
1. Shell structure	\$400
2. Tiles	\$310
Stage III	
1. Glass wall/mullions	\$300
2. Internal floor (ceilings, walls and partitions etc)	\$500
3. Services	\$150

Weather would not be a source of major delays.

What's missing 'in between'?

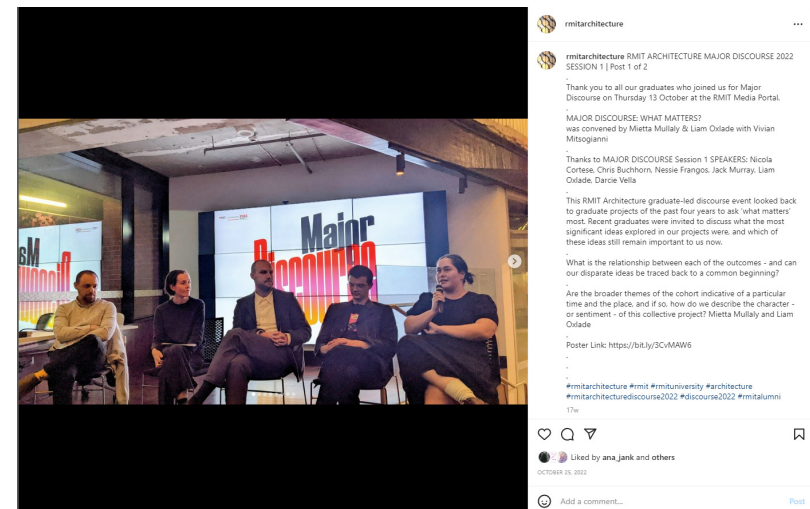

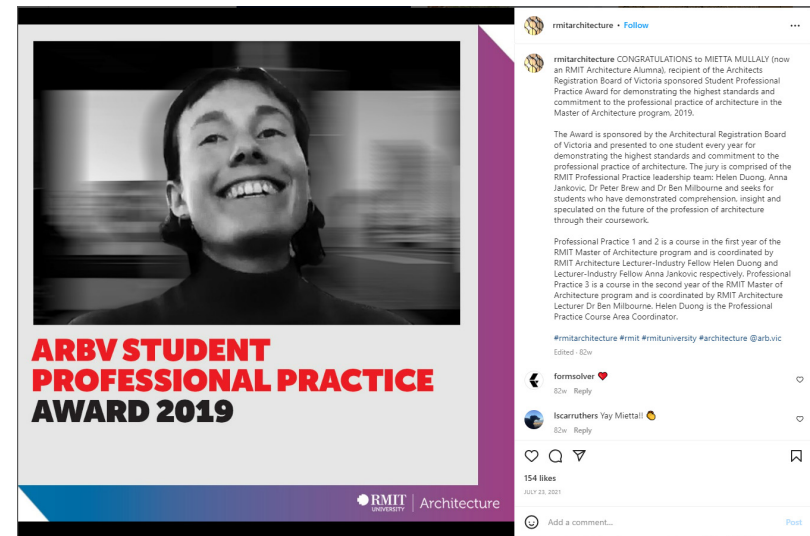

Australia's 2021 Venice Architecture Biennale exhibition, *Inbetween*, commendably showcases projects with a high degree of Indigenous engagement. But, asks Louis Anderson Mokak, are we celebrating prematurely?

PROJECTS | Louis Anderson Mokak | 26 May 2020

Memory keeper: *In Absence*

A collaboration between architect and artist, this poignant work in the gardens of the National Gallery of Victoria challenges the colonial legacy of art institutions, interrogating the absence of truth in the western canon and asking: how can architecture reconcile with the brutality of an unlawful and violent colonial history?

What makes good architecture or a good architect? Join us as we dive behind the scenes of the architectural profession and examine the roles and responsibilities of those who work in the field.

Architecture is often judged by aesthetics, but this does not always distinguish one architect from another, nor a good one from a bad one.

What does the licensure, the regulations and contractual systems that surround architecture actually cause? How do these legal mechanisms allow architects to be accountable, to have a duty to the public, and a decision-making process regardless of whether they are good or bad?

Conceptual Frames for the Nurturing of Professionalism and Care in Architectural Education

Helen Duong & Peter Brew
Royal Melbourne Institute of Technology (RMIT University)

ABSTRACT

The need for architects to recognise their obligation to care for something is argued by Jeremy Till in Architecture Depends, underlining the ethical responsibility of the architect.

Within Australia, various legal, professional and regulatory codes and laws provide a framework that allows an architect's knowledge, skills, and service value to be exchanged for the trust of the client and public. This paper aims to illustrate that professional practice subjects within architecture course curricula have the potential to nurture students and encourage them to reflect on the profession rather than the individual, and to consider what is at stake in their practice for architecture rather than the architect. A series of conceptual frames drawn from various philosophical branches have been used to focus this inquiry and analyse the importance of professional ethics, architecture as a Foucauldian 'apparatus' and the need for a paradigm shift.
