What is a Profession?

Definition

The Australian Council of Professions defines a '**Profession**' as:

A Profession is a disciplined group of individuals who adhere to ethical standards and who hold themselves out as, and are accepted by the public as possessing special knowledge and skills in a widely recognised body of learning derived from research, education and training at a high level, and who are prepared to apply this knowledge and exercise these skills in the interest of others.

It is inherent in the definition of a Profession that a code of ethics governs the activities of each Profession. Such codes require behaviour and practice beyond the personal moral obligations of an individual. They define and demand high standards of behaviour in respect to the services provided to the public and in dealing with professional colleagues. Often these codes are enforced by the Profession and are acknowledged and accepted by the community.

Australian Council of Professions, 2003

Being a member of a Profession, e.g. a '**Professional**', is generally seen as an indicator of integrity, ethics, trust and expertise.

Introduction

➤ 1. Design: Project briefing

➤ 2. Design: Pre-Design

➤ 3. Design: Conceptual Design

➤ 4. Design: Schematic Design

➤ 5. Documentation: Detailed Design

➤ 6. Documentation: Documentation

➤ 7. Project Delivery: Procurement

➤ 8. Project Delivery: Construction Stage

➤ 9. Practice Management

▼9. Practice Management

9.1 Knowledge and implementation of appropriate practice model to ensure efficient, effective and ethical professional service.

9.2 Knowledge and application of practice resources required to ensure efficient and effective professional service.

9.3 Identification and application of practice systems and quality management systems to facilitate efficient and timely delivery of architectural services in accordance with project objectives

9.4 Establishment of project team and practice structures required to deliver the professional services in a timely manner.

9.6 Knowledge of the legal and ethical obligations relating to copyright and intellectual property requirements.

9.6 Knowledge and application of professional ethics and ethical practices in respect to practice management and provision of professional service.

9.7 Knowledge of legal and regulatory requirements and obligations in regard to architectural practice, practice management and registration as an architect.

9.8 Clear and consistent communication with client and relevant stakeholders throughout project.

9.9 Provision of independent and objective advice through all phases of professional practice.

PERFORMANCE CRITERIA FOR **PRACTICE**
MANAGEMENT AND PROFESSIONAL CONDUCT

On graduation from an architecture program — a graduate will				
PC 1	Understand the regulatory requirements and obligations pertaining to practice as an architect, including professional codes of conduct and obligations for continuing professional development and professional indemnity insurance.			
PC 2	Understand the role of quality assurance systems in facilitating efficient and timely delivery of architectural services.			
PC 3	Understand the principles of project planning, considering implications for Country, environmental sustainability, communities, stakeholders and project costs.			
PC 4				
PC 5	Understand the essential elements of a client architect agreement, across the range of procurement methods and the different scales and types of project.			
PC 6	Understand appropriate processes for reporting and varying the scope of services provided by an architect.			
PC 7	Understand appropriate processes for clear and consistent communication with clients and relevant stakeholders throughout a project, including obtaining approvals from clients and stakeholders.			
PC 8	Understand how to implement culturally responsive and meaningful engagement processes that respect the importance of Country and reciprocal relationships with Aboriginal and Torres Strait Islander Peoples across architectural services.			
PC 9	Understand contemporary and emerging building procurement methods. This involves identifying the most appropriate form of delivery for a project, including associated risks, mitigation and adaptation strategies, and understanding appropriate construction and consultant contracts and agreements.			
PC 10	Understand the whole life carbon implications of procurement methods, materials, components and construction systems.			
PC 11				
PC 12	Understand how relevant building codes, standards and planning controls apply across architectural practice, including climate change implications, the principles of fire safety, and barriers to universal access.			
PC 13	Have knowledge of documentation processes that facilitate project delivery appropriate to selected procurement processes.			
PC 14				
PC 15	Understand legal and ethical obligations relating to copyright, moral rights, authorship of cultural knowledge and intellectual property requirements across architectural services.			
PC 16	Understand risk management and mitigation principles and strategies – including safety in design, project risk, requirement for resilience from the impacts of climate change and appropriate insurances – across architectural services.

Pro bono work

PRACTICE Published: 25 November 2015 | Edited: 4 January 2020

Architects may provide pro bono services to a range of groups including community groups such as preschools or the scouts, through membership of churches, sporting or social clubs and out of a spirit of social compassion for communities in need, such as the victims of natural disaster.

Page contents

- [Taking on pro bono work](#)
- [Pro bono risk-management strategies, bushfires](#)

Taking on pro bono work

The Institute's Code of Conduct expects architects to:

- serve and advance the public interest through appropriate involvement in civic activities, as citizens and professionals
- promote environmental awareness and the appreciation of architecture and urban design
- encourage informed public debate on architectural and urban design issues
- respect, conserve, and enhance, the natural and cultural environment

There is an additional expectation that architects will consider the importance of engagement with the community in times of crisis through the provision of reduced-fee or pro bono work in the design and management of shelters and other buildings following natural or man-made disasters, and assisting charitable and other non-profit institutions, similarly through the provision of reduced-fee or pro bono work.

Some architects may provide pro bono services to a range of community groups with which the individual or firm already has contact. There are also structured not-for-profit organisations which have a mission to engage the Australian design professions in pro bono projects that improve the living conditions of communities in need with a focus on the Asia-Pacific region. Some of these are:

- Emergency Architects, Australia: [LinkedIn page](#)
- Engineers Without Borders: [www.ewb.org.au](#)

Doctor

Continuum

Goode (1969)

"There were limits to which an occupation could professionalise because society did not accept some occupations as having sufficient of the two core elements. **Knowledge base** and **service ideal**

Four great profession's law medicine ministry and university teaching, share is **getting inside the client**. the attachment and vulnerability of this required a strong adherence to a set of norms and ethics.

Semi professionals having not the **knowledge skills** and **service value to exchange** for **public trust**

...whether the substance of the task requires **trust** and therefore **autonomy** and therefore some cohesion through which the occupation can in fact impose ethical control on its members

This questions what the relationship is between the architect and the client.

This questions what mechanism or circumstances allow for an exchange. I.e. The Architects Act

The Current Context

settlement and withdrew their involvement before the hearing.

Judge Woodward's findings

His Honour found that:

1. The external cladding specified in the original design, namely Alucobond, failed to comply with the Building Code of Australia (BCA). The substitute aluminium composite cladding (ACP) ultimately installed also failed to comply with the BCA and accordingly, the *Building Regulations 2006 (Vic)*.
2. In installing the cladding, L U Simon breached the implied warranties of suitability of materials, fitness for purpose and compliance with the law set out in section 8 of the *Domestic Building Contracts Act 1995 (Vic)* and is therefore liable to pay damages to the Owners. However, his Honour found that L U Simon did not fail to exercise reasonable care in the construction of the Tower.
3. Each of the consultants (Gardner Group, Elenberg Fraser and Thomas Nicolas) breached their obligations to L U Simon under their respective consultant agreements (which were novated to L U Simon by the developer) by failing to exercise due care and skill in that:
 - Gardner Group issued a Building Permit for the relevant stage of the building approving the specification by Elenberg Fraser of the ACP. Gardner Group also failed to notice and query the incomplete description of the cladding system in a report produced by the Thomas Nicolas.
 - Elenberg Fraser failed to remedy defects in its design (namely the specification of ACP and design drawings providing for extensive use of ACPs at the Tower) which caused the design to be non-compliant with the BCA and not fit for purpose. Elenberg Fraser also failed as head consultant to ensure the ACP sample provided by L U Simon was compliant with Elenberg Fraser's design intent as articulated by its specification and the BCA.
 - Thomas Nicolas failed to conduct a full engineering assessment of the Tower in accordance with the International Fire Engineering Guidelines and failed to include the results of that assessment in its fire engineering report. Thomas Nicolas also failed to recognise that the ACP used at the Tower did not comply with the BCA and did not warn L U Simon (or Gardner Group, Elenberg Fraser or PDS) accordingly.
 - The resident, Mr Gubitta, had breached a duty of care owed to the Owners by failing to take care in the disposal of his smouldering cigarette, but concluded that his responsibility for the loss and damage was minimal.

The Idea

If one produces a building one does not produce all the **accidental qualities** that come into being with a building. (in fact, there is an infinity of the latter. It happens very often that a building produced provides **pleasure** for some, **harm** to others and **convenience** for still so that the building can be described as different from every other thing that is, but the architect has not produced any of these accidental properties) others...

Aristotle. Epsilon II, Metaphysics

We are doing more things than we think. However we only own up to the pleasurable qualities. We need to have clear intentions and be responsible for all things we do, not just what we claim to do.

The first is a question of **ethics**, (to what is a thing, a thing)

Accident

An accidental expression is in effect an expression without a definition. Plato's definition of sophistry of dealing with that **which is not**... Such as if **musical** and **literate** expression can be the same thing.

Aristotle. Epsilon II, Metaphysics

The second one of a **method** (how we gain access to a thing)

Accident
